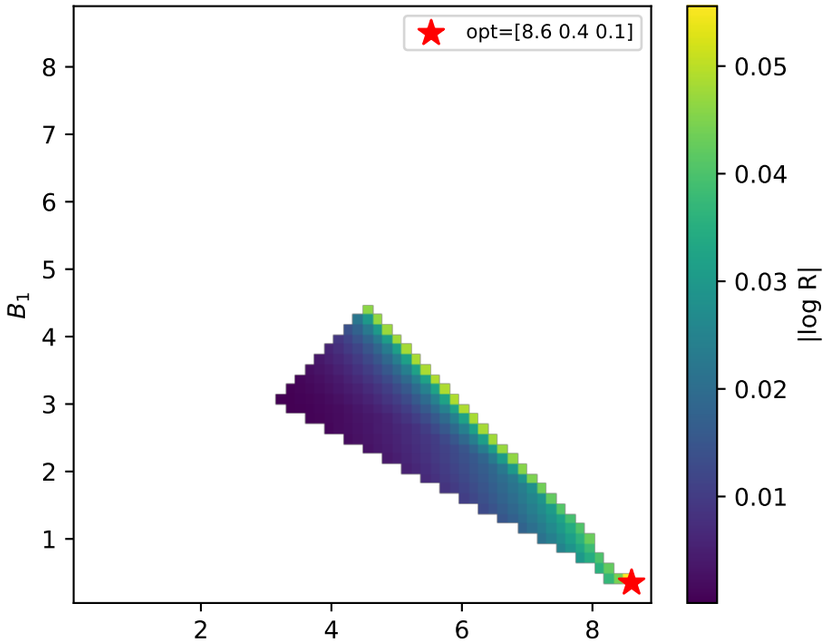
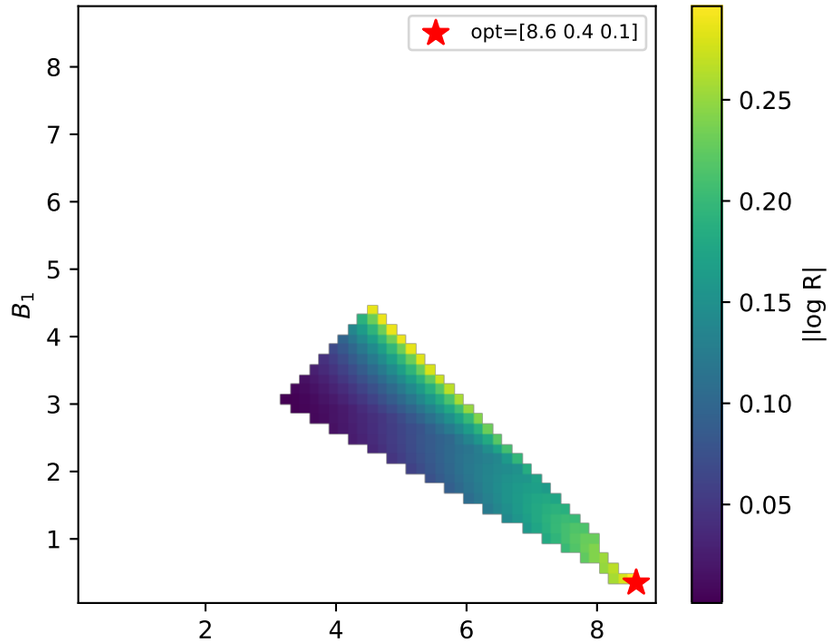
Extreme budget analysis: $N = 3$, $K = 2$, $f(x) = x^{\alpha}$

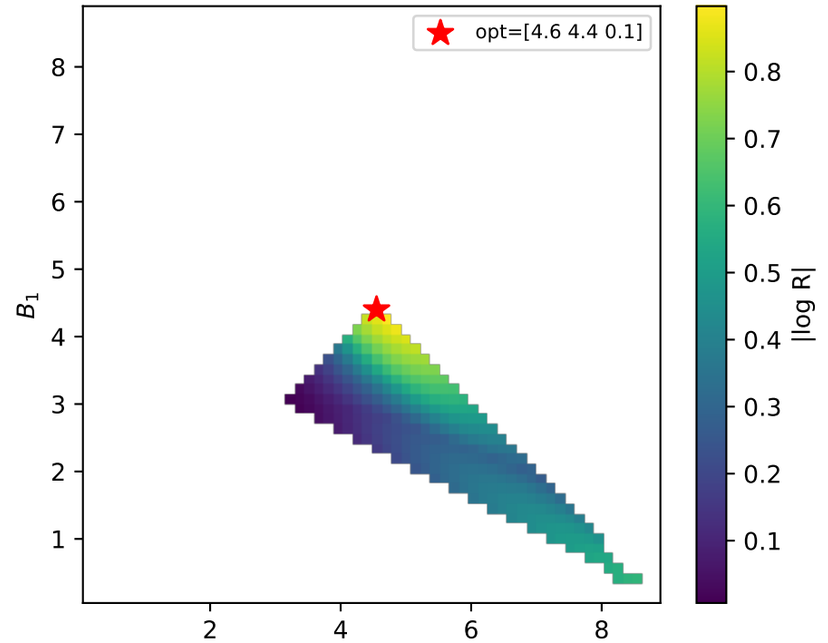
$\alpha = 0.25$: max|log R| in (B_0, B_1)



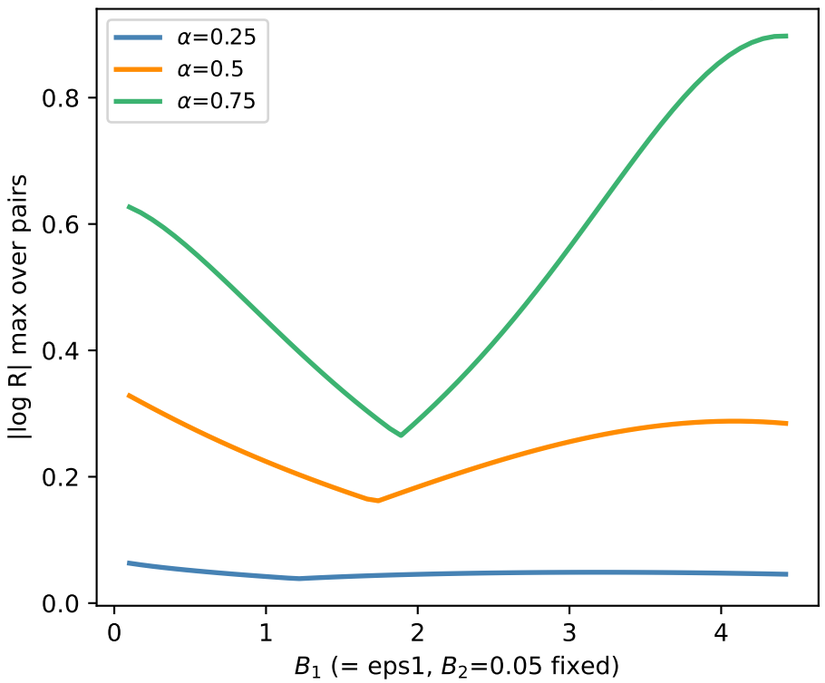
$\alpha = 0.5$: max|log R| in (B_0, B_1)



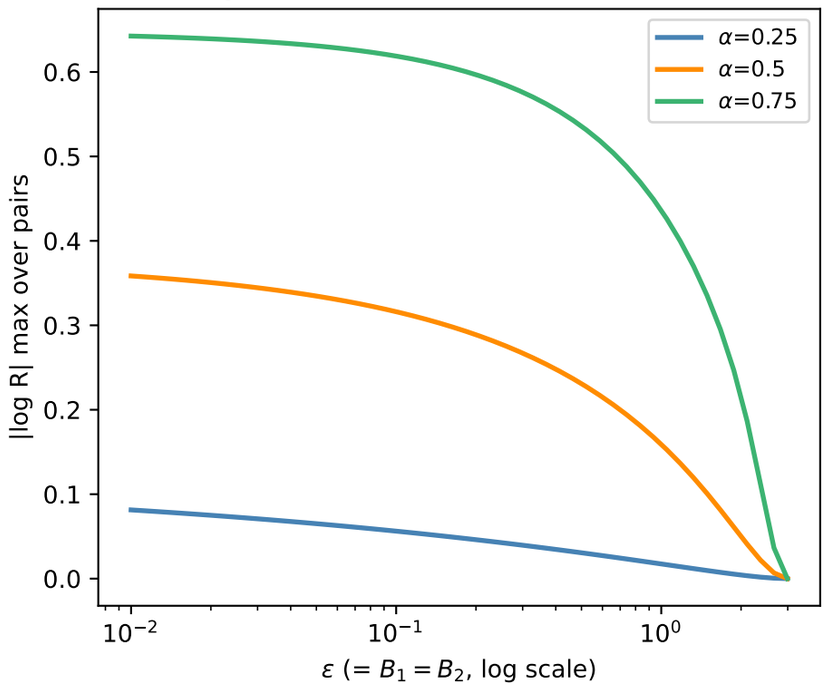
$\alpha = 0.75$: max|log R| in (B_0, B_1)

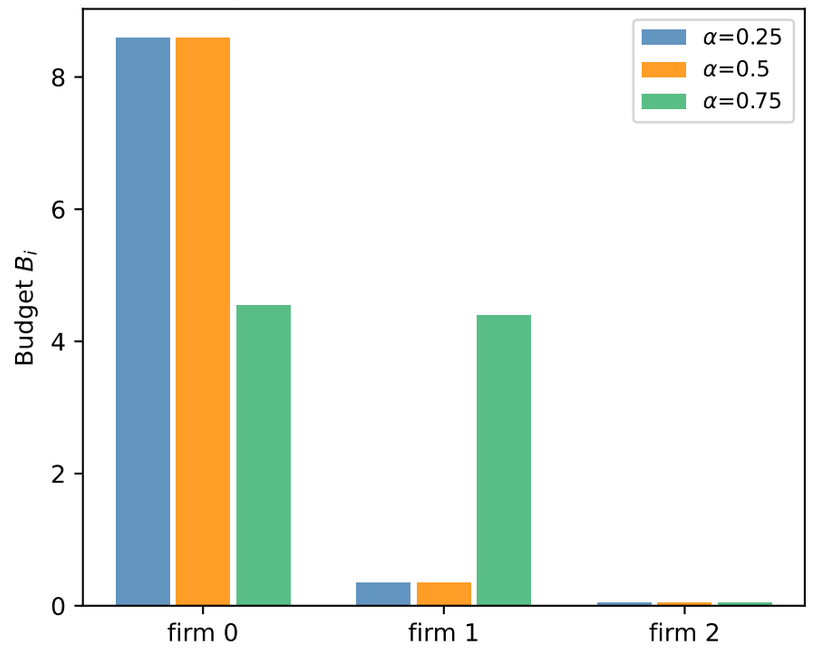


Limit: $B_0 = 9 - B_1 - 0.05$, sweep B_1



Symmetric: $B_0 = 9 - 2\varepsilon$, $B_1 = B_2 = \varepsilon$





Optimal B (ordered $B_0 > B_1 > B_2$)
