Nash allocation shares vs w_k for $f(x) = \log(1+x)$, varying σ_c center
(dots should lie on y=x line if proportional allocation is Nash)
σ_c, c=0.1
(KL_Nash=6.4e-01)
σ_c, c=0.25
(KL_Nash=3.1e-01)
σ_c, c=0.5
(KL_Nash=3.0e-01)
σ_c, c=0.75
(KL_Nash=2.8e-01)
σ_c, c=0.9
(KL_Nash=2.8e-01)
firm 1 (B=4.2)
firm 2 (B=4.2)
firm 3 (B=3.1)
firm 4 (B=2.1)
y=x (proportional)
$x_{i,k}/B_i$ (share)
w_k (evaluator weight)
